"South's Largest Nursery"

RETAIL PRICE LIST

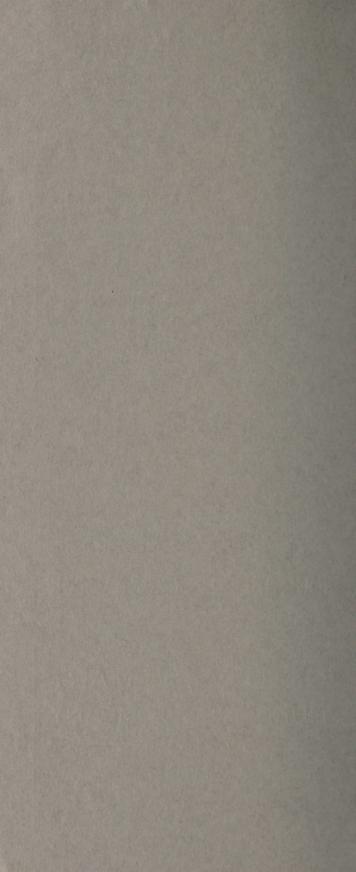

SPRING-1941-SUMMER

GLEN SAINT MARY NURSERIES COMPANY

59 Years in Business

GLEN SAINT MARY, FLORIDA

Our Message to You

Here is the Price List we have been promising for so long; we regret that it cannot be more complete.

Our plan is to issue the regular illustrated Nursery Book early next Fall and we assure you that your continued patronage so far this season, in spite of our lack of catalogues, has made us properly grateful for so many good friends.

We shall welcome opportunities of serving; please ask for any information desired about any plant or tree listed herein—and remember that the Spring and Summer months need not be a STOP sign for planting. Balled & Burlapped (B&B) plants are an easy answer to that problem and our well known guarantee still protects you against unusual losses.

TERMS OF BUSINESS

- LOCATION. General Office and Nurseries at Glen Saint Mary, Baker County, Florida, on Seaboard Air Line Railway, and State Road No. 1, 30 miles west of Jacksonville. Office and Citrus Nurseries at Winter Haven, Polk County, Florida. Visitors are always welcome.
- APPLYING PRICES. Orders for five (5), fifty (50), and five hundred (500) plants of one variety command the 10, 100, and 1000 rates respectively.
- CASH or satisfactory reference must accompany all orders for immediate shipment unless the party ordering has an account. On orders booked in advance of the shipping season, 25 per cent down, with the balance due when the shipping season opens, will be required.
- BE SURE to state clearly when ordering how you wish shipment made—Parcel Post, Express, or Freight. Lacking this information, we will use our best judgment as to method of forwarding. On orders for shipment by Parcel Post, add 25 per cent to the list price to cover cost of packing and postage. Please use our order blanks; additional ones will be mailed on request.
- SHIPPING AND PLANTING SEASON. From the middle of November through March for bare-rooted plants. Planting season for B&B ornamentals is limited only by amount of watering and other care customer is prepared to give.
- SUBSTITUTION. It is our desire to furnish stock exactly as ordered. On orders for commercial planting, substitution of varieties will not be made without permission from customer. On small orders, items which we are unable to supply will be omitted unless we are instructed to substitute.
- WE GUARANTEE all stock sent out to be well rooted, well grown, true to name, properly packed, and shipped according to instructions. Our liability under the foregoing guarantee is limited in amount to the original price received. There shall be no nursery stock sold under a guarantee to live, except with the understanding that it will be replaced within 6 months from date of sale if it dies, at not less than 50 per cent of the purchase price, which shall be considered as insurance.
- CLAIMS. If, by any possibility, errors should occur, they will be promptly rectified, if claim is made within 10 days after the receipt of goods. Our responsibility ceases upon delivery of nursery stock in good condition to public carrier.

AZALEAS

We head our list with AZALEA GEORGE LINDLEY TABER, a sport of Omurasaki originating here, and named for our founder, the late George Lindley Taber.

Its predominant color is soft lavender-pink, faintly streaked with darker pink and more distinctly mottled cerise toward the throat . . . slightly fragrant, the flowers are nearly as large as those of popular Formosa.

A rapid grower, the Taber is valuable as a substitute for, or in combination with, the lavenders such as Formosa and Phoenicea where a harmonious color-break is desired. It usually blooms here in March. We have found it extremely resistant to cold.

NATIVE AZALEAS

AZALEA AUSTRINA (Florida Flame Azalea). This beautiful Azalea, native in northwestern Florida, blooms in March and April. The spicy-scented flowers vary in color from light yellow through orange to orange-red. Plants grow to a height of 8 to 10 feet.

AZALEA CANESCENS (Native Azalea; Wild Honeysuckle). The most common of the native Azaleas and is found throughout northern Florida and southern Georgia, growing on moist, but well-drained acid soil. The trumpetshaped flowers are usually pink in color, but white-flowered and deep pink specimens are sometimes found. They grow to large size, but are readily kept at any desired size by pruning. The blooming season is in February and March.

Roses out for this season

SHRUBS AND HEDGE PLANTS WIRE BALLING

Wire Balling is an improved balling method we have found highly successful in digging the larger sizes of some items such as Magnolia, Holly, Oak, Standard Crape Myrtle, etc. The system makes it easy to get larger root balls, more securely held together than is possible with regular B&B handling. This extra margin of safety is often desirable, and the Wire Balling may be specified at the discretion of the customer to other trees and other sizes than those mentioned herein.

SHRUBS AND HEDGE PLANTS-Continued

FLOWERING QUINCE (Cydonia japonica)—Until very recently, these Chaenomeles have been rather neglected by the gardeners of Florida, perhaps because they were considered more of Northern subject and not so suitable for Southern conditions. They have been grown at Glen Saint Mary for two years now with good success; and we do not hesitate to recommend both the red and the pink flowering varieties for vivid and profuse Spring color. Half deciduous in this section, they seldom attain more than five feet in height, with about the same spread. ige re.

tain more than five feet in height, with about the sa Spiney branches, leaves broad ovate to two inches lon toothed. Flowers average one inch in diameter and scarlet or salmon pink—two distinct types, so far unne Both mature yellow fruit.	me spread. g, coarsely are orange amed here.

Write Winter Haven Office for quotations on Citrus for Central and South Florida.

The Satsuma Orange, in the opinion of many, is the most profitable fruit that can be grown north of the round orange territory. From Savannah, Ga., along the Atlantic Seaboard South, North Florida, extreme southern portions of Louisiana and Mississippi, it is a profitable money crop. Our trees on Citrus Trifoliata, pure Owara strain, grown with the greatest of care will make profitable groves. Also, for home use it is a welcome addition to the usual home orchard.

DECIDUOUS FRUIT AND NUT TREES-Continued

BABCOCK PEACH — This new peach of Dr. Babcock's was introduced by the Southern California U. S. D. A., and is fine for Southern conditions. It is an exceedingly attractive red peach with white flesh, remaining very hard until thoroughly ripe. Fruit of the Babcock will average small to medium, but we have reports of large fruit having been produced under certain conditions. The flavor is mild and non-acid. The trees will bear the first year in the orchard or home grounds, but should not be permitted to mature fruit at the expense of growth. We are told by the men closely associated with the Babcock since its introduction that grove trees under observation have never missed a crop, which in Peach circles, is remarkable. In addition, the trees seem to suffer hardly at all from the common fault in warm latitudes, of delayed foliation. Another valuable characteristic of Babcock, is its astonishing ability to cling to the trees through severe wind storms, even when quite ripe. Commercially, this can mean money to the grower, and to the home experimenter is, at least, a great satisfaction.

CULTURAL NOTE: Because of its prolific habit, this variety should be heavily pruned and thinned for best results.

TO SECURE MAXIMUM RESULTS FROM TREES AND SHRUBS, THE PLANTER SHOULD:

- (1) See that the ground is well prepared,—spaded or loosened up and put in the same condition as if it were to be planted to a vegetable garden.
- (2) Keep the ground cultivated clean around newly set plants. If a single plant is set, there should be a circle around it from 18 to 30 inches across, depending upon the size of the plant.
- (3) Fertilize by giving each plant one-half pound of raw ground bone or a shovelful of well rotted cow raw ground sone or a shovelful of well rotted cow manure. They are two of the best fertilizing materials known for practically all ornamental shrubs, except Azaleas. The raw ground bone should be thoroughly mixed with the soils used in filling up the holes about the plants. The cow manure may be used the same way, or it may be scattered on top of the ground around the plant on a uniform description. the plant as a surface dressing.

ARBORVITAES
RETINOSPORAS
PODOCARPUS

(4) and other plants which carry a ball of earth about the roots should be set at a depth where the top of

PALMS

Description of the ball is flush with the level of the ground. If the plants are in pots, do not attempt to pull the plants out, but hold the plant upside down and lift the pot off. If the ball of earth has burlap around it, do not remove it.

Set the plant in the hole with the burlap on and then cut the twine and loosen the burlap at the top; fill in the earth loosely, pour in a bucket of water, allow it to sink away, then finish filling up the hole with dry earth and pack

AZALEAS (5) require treatment somewhat different from most other plants. They like an acid soil. If the ground is not naturally acid, it is best to use muck or fresh woods earth for filling up the holes. Azaleas should be planted the same way as recommended in (4), instead of fertilizing with raw ground bone or cow manure, use cotton seed meal or castor pomace. Both of these materials help to retain acidity. After the plants are set and the ground leveled off, a layer several inches thick of dry leaves or straw will shade the roots and be

ROSE BUSHES, (6) and other plants handled bare-crape myrrles, rooted should be planted at the same depth as they stood in the nurseries. This can be determined PECANS, PLUMS by the earth marks or difference in the color of the bark. The holes should be dug a little larger than necessary to accommodate the plants; the roots should be carefully spread out in their natural positions and the soil packed in between and under the roots by hand. When the holes are three-quarters filled, pour in a bucket of water and finish up as recommended in (4). Use raw ground bone and cow manure liberally on roses, but use only bone meal or commercial fertilizer on fruit trees, at the rate of one-fourth pound per tree.

No pruning of any kind is required at planting time. Our trees and plants are pruned properly at the nurseries by experts.
